EventForce Management System

Business Name: “EventForce Management System”

Objectives

The objective of the EventForce Management System is to build a cloud-based CRM application on Salesforce that digitizes and automates event management operations. The system connects clients, event coordinators, vendors and venues in one platform, so that client bookings, venue reservations, vendor coordination and feedback collection are handled in a single place.

By using centralized records, automated business processes, role-based security and reports and dashboards, the project aims to reduce manual work, keep data accurate and give event teams useful insight into upcoming events.

Application Overview

The solution is delivered as a custom Salesforce Lightning application named Event Planner. It contains six custom objects: Event, Client, Vendor, Venue, Feedback and Event Vendor (junction object). Automation is implemented with Flow, Approval Process, Apex Classes and Apex Triggers, and access is controlled through Profiles, Roles, Permission Sets and Sharing Settings.

Phase 1: Requirement Analysis & Planning

Build an EventForce Management System in Salesforce to help event planners manage client bookings, vendor coordination, venue reservations and feedback collection within a single CRM platform. The system automates event scheduling, cancellation approvals and client reminders, and provides visibility through reports and dashboards.

Functional Scope

- Custom objects: Event, Client, Vendor, Venue, Feedback and Event Vendor (junction object).
- Relationship modeling: Lookup, Master-Detail and Many-to-Many (Event and Vendor).
- Automation using Flow for client reminders.
- Validation rules and formula fields for accurate data entry and event budget.
- Approval process for event cancellation requests.
- Apex classes and triggers for venue availability and double-booking prevention.
- Batch Apex and Scheduled Apex to complete past events automatically.
- Profiles, Roles, Permission Sets and Sharing Settings for security.
- Reports and dashboards for upcoming event insights.

Stakeholder Mapping

Stakeholder	Responsibility
Clients	Request event services, provide feedback and view event updates.
Event Coordinators	Manage event scheduling, client communication and approval workflows.
Vendors / Vendor Managers	Handle assigned event services and vendor details.
Venue Managers	Manage venue availability and reservations.
Event Administrators	Oversee system operations, security and data monitoring.

Execution Roadmap

1. Object and field setup for Event, Client, Vendor, Venue, Feedback and Event Vendor.
2. Tabs, validation rules and formula fields.
3. Automation: Flow and Approval Process.
4. Apex classes, triggers, Batch Apex and Scheduled Apex.
5. Lightning app, reports and dashboard.
6. Profiles, roles, users, permission sets and sharing settings.

Phase 2: Backend Development & Configurations

This phase builds the core functional engine of the system using objects, fields, relationships, validation rules, automation and Apex logic.

Milestone 1: Salesforce Account

Salesforce is a customer success platform used to manage relationships with customers, collaborate with employees and partners, and store data securely in the cloud. The project was built in a Salesforce Developer Edition org.

Activity: Creating the Developer Account

1. Open <https://developer.salesforce.com/signup> and fill in the sign-up form.
2. Verify the account using the email sent by Salesforce and set a password.
3. After login, the Salesforce Setup home page opens.

Figure 1: Salesforce Setup home page of the Developer Edition org

Data Architecture

Custom Objects

Object	Fields
Event	Event Name, Event Date, Event Type, Event Status, Event Budget (formula)
Client	Client Name, Email, Phone, Address, Country, City
Vendor	Vendor Name, Email, Phone, Service Type, Status
Venue	Venue Name, Address, Location, Capacity, Availability Status
Feedback	Feedback ID (Auto Number), Rating, Comments
Event Vendor	Junction object linking Event and Vendor

Relationships

Relationship	Type	Purpose
Event to Client	Lookup	Client who booked the event
Event to Venue	Lookup	Venue reserved for the event
Feedback to Event / Client	Lookup	Feedback given for an event
Event Vendor to Event	Master-Detail	Many-to-many link
Event Vendor to Vendor	Master-Detail	Many-to-many link

Milestone 2: Objects

Salesforce objects are database tables that store organization-specific data. They consist of fields (columns) and records (rows).

Activity: Create a Custom Object

1. From Setup, open Object Manager and choose Create, then Custom Object.
2. Enter the label and plural label (for example Event and Events).
3. Set the record name, keep Allow Reports and Allow Search enabled, and save.
4. Repeat for Client, Vendor, Venue, Feedback and Event Vendor.

Figure 2: Creating the Event custom object

Figure 3: Client object: selecting the Phone field type

Figure 4: Event Vendor object fields and master-detail relationships

Milestone 3: Tabs

Custom tabs were created for Clients, Events, Feedbacks, Vendors and Venues so that users can open each object from the application navigation.

Figure 5: Custom Object Tabs in Setup

Milestone 4: Fields and Relationships

Fields were created for every object, and relationships were configured between them. The Event object contains Event Name, Event Date, Event Type, Event Status and an Event Budget field created as a currency formula field.

Figure 6: Creating the Event Budget formula field

Figure 7: Fields and relationships of the Event object

Milestone 5: Validation Rules

A validation rule on the Client object (Email_Valid_Address) checks the email format before a record is saved. If the email is not valid, the message “Please Enter Valid Email Address” is displayed on the Email field.

Figure 8: Client validation rule: Email_Valid_Address

Milestone 6: Approval Process

An Event Cancellation Approval Process was implemented. When an event cancellation request is submitted with the status Pending Cancellation, it is sent for approval. If the request is approved, the event status changes to Cancelled and the required notification is sent. If the request is rejected, the corresponding rejection action and notification are performed.

Email templates used for notifications are available in Setup under Classic Email Templates.

Figure 9: Classic Email Templates in Setup

[Screenshot to be added: Approval Process configuration]

Milestone 7: Flows

A record-triggered Client Reminder Flow was created. When an event is confirmed, a scheduled path sends a reminder email to the client three days before the event date. The event owner is also included in the notification.

Figure 10: Record-Triggered Flow with the 3_Days_Before scheduled path

Milestone 8: Apex Classes

Apex automations manage venue availability. When an event is confirmed, the venue status changes to Reserved; when the event is cancelled, the venue status returns to Available.

Action	Name	Namespace Prefix	Api Version	Status	Size Without Comments	Last Modified By	Has Trace Flags
Batch Security	BatchCompleteEvents	devedapp	67.0	Active	651	BAMYA.S, 10/3/2026, 2:40 AM	☐

Figure 11: Apex Classes in Setup (BatchCompleteEvents and ScheduleCompleteEvents)

Milestone 9: Apex Trigger

A separate trigger prevents double booking, ensuring that two events cannot be scheduled at the same venue at the same time.

[Screenshot to be added: Apex Trigger for venue reservation and double-booking prevention]

Milestone 10: Batch Apex and Scheduled Apex

The Batch Apex class (BatchCompleteEvents) processes past event records and updates their status to Completed. The Scheduled Apex class (ScheduleCompleteEvents) runs this operation automatically on the configured schedule, so users do not need to update completed events manually.

Phase 3: UI/UX Development & Customization

Milestone 11: The Lightning App

A custom Lightning application named Event Planner was created. Its navigation contains Events, Venues, Clients, Vendors, Feedbacks, Reports, Dashboards and Event Vendors.

Activity: Create a Lightning App

1. From Setup, open App Manager and choose New Lightning App.
2. Enter the app name Event Planner and complete the app details.
3. In Navigation Items, move the required items to the Selected Items list.
4. Assign user profiles and save.

Figure 12: Event Planner Lightning app with the Event Vendors list view

Figure 13: Navigation items of the Event Planner app

Milestone 12: Reports

The Upcoming Events by Month report (Events with Venue) was created. It groups events by Event Date and helps users monitor upcoming events and organize event information by month.

Figure 14: Upcoming Events by Month report

Figure 15: Report builder: grouping, columns and chart properties

Milestone 13: Dashboard

The EventForce Operations Dashboard provides a visual overview of event operations, including upcoming event information.

[Screenshot to be added: EventForce Operations Dashboard]

Phase 4: Data Migration, Testing & Security

This phase prepares and secures the system. Access to data is controlled with profiles, roles, users, permission sets and sharing settings.

Milestone 14: Profile

A custom profile named Vendor Manager (Salesforce Platform license) was created to control what vendor managers can access.

Figure 16: Profiles in Setup

Milestone 15: Roles

The main user roles are Event Admin, Event Coordinator, Vendor Manager and Client. Each role has controlled access based on its responsibility.

[Screenshot to be added: Role hierarchy]

Milestone 16: Users

Users were created and assigned to roles and profiles, for example Event Coordinator, Vendor Manager and System Administrator.

Figure 17: Users list showing roles and profiles

Milestone 17: Permission Sets

Permission sets give users additional access without changing their profile. The Feedback Manager permission set was assigned to a user, and the assignment completed successfully.

Figure 18: Permission Sets in Setup

Figure 19: Object permissions inside a permission set

Figure 20: Feedback Manager permission set assignment

Milestone 18: Sharing Settings

Organization-wide defaults control record visibility, while roles and sharing configuration provide the required access to users. The custom objects Client, Event, Feedback, Vendor and Venue are configured in the Sharing Settings page.

Figure 21: Organization-wide defaults in Sharing Settings

Figure 22: Sharing Settings for Client, Event, Feedback, Vendor and Venue

Overall Workflow

1. Client and event records are created and managed.
2. The event is associated with a venue and vendors.
3. When the event is confirmed, the venue is reserved and the client reminder is scheduled.
4. If cancellation is requested, the approval process handles the request.
5. Apex automation manages venue availability and prevents double booking.
6. After the event date has passed, the scheduled process updates the event status to Completed.
7. Reports and the dashboard provide an overall view of event operations.

Conclusion

The EventForce Management System brings event management activities into one centralized Salesforce platform. It combines data management, automation, security and reporting to reduce manual work and improve operational efficiency.
